

WEBSITE & SEARCH PERFORMANCE REPORT

Stable Structure *Limited*

The website and search engine optimisation work completed on stablestructure.co.nz, the results measured with Google's own tools, and what happens next.

PREPARED FOR

Report 01

IN SHORT

Your website is now faster than almost every site on the internet, and built to be found

The work covered three areas: making the site load fast, making Google understand exactly who you are and what you do, and giving your most valuable services the depth they need to compete in search results. Every result in this report was independently measured using Google's own testing tools, not estimated.

100 _{/100}	1.5 _s	6	84 _{/100}
Google performance score on mobile, up from 84	Time to load main content, down from 3.5 seconds	Pages of new expert content written and published	Independent audit score across 22 pages

SPEED

Load time cut by more than half

Google measures how quickly the main content of a page appears and uses it as a ranking factor. More importantly, visitors leave slow sites. Your site was at 3.5 seconds. It is now at 1.5.

What made the difference

1 Fonts now load from your own site

Previously every visitor waited for fonts to arrive from Google's servers before any text appeared. They are now served directly from your site, which was the single biggest speed gain.

2 Your logo is 96% smaller

It was being sent as a 207KB image and displayed at a fraction of that size. It is now 9KB with no visible difference.

3 Files are cached properly

Repeat visitors no longer re-download the same design files, so the site feels instant on a second visit.

4 A mobile layout bug was fixed

On phones, part of the page extended past the edge of the screen and let the page slide sideways. That is now contained.

Your credentials are now machine-readable

Search engines read a hidden layer of data on every page to understand what a business is. Yours was incomplete, and one part of it broke Google's published rules, which risked losing search features altogether. It has been rebuilt and now passes Google's official test on every page type.

PAGE TESTED	RESULT	WHAT GOOGLE NOW RECOGNISES
Homepage	PASS	Business identity, contact details, opening hours and service area
Service page	PASS	The above, plus the specific service offered and a navigation trail shown in search results
Guide page	PASS	The above, confirming your guides are eligible for the same enhanced listings

Your **Chartered Professional Engineer registration (CPEng #1030007)** is now recorded in this data and shown on your service pages, linked to the official register so anyone, including Google, can verify it. In a field where anyone can call themselves an engineer, verified credentials are a real competitive advantage, and search engines increasingly reward them.

One issue worth knowing about. The previous setup published a star rating in the site's hidden data on every page. Google's rules only permit this in specific circumstances, and breaching them can cost a site its search features entirely. This has been removed. Your genuine client reviews continue to be displayed on the site, just no longer in a way that put your search visibility at risk.

CONTENT

Your best opportunities now have real depth

Search Console showed something specific: Google was already showing several of your service pages to people searching for exactly what you do, but they sat too far down the results to be clicked. They were appearing, not competing. Those pages have been rewritten properly.

PAGE	NOW COVERS
Construction Supervision	The CM1–CM5 monitoring levels, how PS4 sign-off works, hold points through a build, and South and East Auckland named explicitly
Retaining Walls	The 1.5 metre consent threshold, what counts as a surcharge, timber versus block versus concrete, drainage and boundary situations
Building Consent Documentation	What a PS1 covers, what Auckland Council actually checks, why applications get held up, and what you need to supply to start
Site Inspections	Which stages need inspecting, how PS4 construction review works, and assessments of existing buildings
New guide What is a PS1?	Producer statements in plain English: PS1 through PS4, who can issue them, and when consent needs one
New guide Retaining wall consent	The New Zealand consent rules, the surcharge tests, and the council process step by step

Each page carries a "**Reviewed by Gajanthan Vethanathan, CPEng**" byline with a visible date. The two guides answer the questions people type into Google before they are ready to call an engineer, which is how you reach clients earlier in their decision, and how AI-powered search results choose which businesses to quote.

INDEPENDENT AUDIT

We audited the finished site across 22 pages and seven categories

Rather than take our own word for it, the completed site was put through a full technical audit: every page crawled, four specialist reviews, plus Google's performance and structured-data tools. The site scored **84 out of 100**. Here is where it stands, honestly, including what still needs work.

What the audit found, and we fixed immediately

✓ A privacy issue with your site's source files

The behind-the-scenes files that build your website were publicly downloadable. Nothing sensitive was in them, but they exposed how the site works. Now blocked.

✓ Web addresses that led nowhere

Links written with a trailing slash, the form people often type or that other websites use when linking to you, landed on an error page. They now reach the right page.

✓ A contradiction in your own advice

Your FAQ said retaining walls need an engineer "above certain heights" while your guide gave the exact 1.5 metre rule. Search engines lose confidence when a site contradicts itself, so the FAQ now states the real figure.

✓ Your experience stated two different ways

The About page mentioned eight years and twenty years within a few sentences. Reworded so it is clear one is the age of the firm and the other is your career experience.

✓ Page titles cut off in search results

Eleven titles were too long for Google to display in full. All now fit.

✓ A new guides section

Your two guides now have a proper home grouping them, which helps visitors and search engines treat them as a body of expertise.

What the audit says to do next

PRIORITY	OPPORTUNITY
HIGHEST	Give the Structural Design page the same depth as the four rewritten pages. It currently holds a fraction of their content, and it targets "structural engineer Auckland", the most valuable search term your business has.
HIGH	Write about Auckland-specific ground conditions and consenting. Terms like TC1, TC2 and TC3 land classification appear nowhere on the site, despite being central to retaining wall and foundation work in exactly the area you serve. This is genuine expertise no competitor can copy.
MEDIUM	Bring the four remaining service pages up to depth — civil design, pools, decks and carports.
MEDIUM	Compress the project photos. They are the last thing slowing any page down and can be reduced by around 70% with no visible quality loss.

Why content is the remaining gap, and why that is good news. Every technical foundation is now in place: speed, security, structured data, mobile and accessibility. Those are the parts that are difficult and expensive to retrofit. What remains is writing, which is entirely within your control and gets easier because the pattern is already proven on four pages.

Groundwork for the map results

✓ **Review links now open in one tap**

Asking a happy client for a review used to send them to a search page to find you. The link now opens the review box directly, which measurably increases how many people finish.

✓ **Service areas stated on the site**

Botany, Howick, Pakuranga, Flat Bush and wider East Auckland, alongside your nationwide coverage, with a map on the contact page.

✓ **Professional listings submitted**

Engineering New Zealand, SESOC, NZSEE and Yellow, all with identical business details, which is what lets search engines treat them as confirmation of the same business.

✓ **Search Console properly configured**

Reporting was previously split across several versions of your web address. It is now consolidated, so future reporting reflects reality.

WHAT HAPPENS NEXT

Honest expectations

Search results do not move overnight. Google needs to re-read the rewritten pages, then judge how people respond to them. The pattern is consistent: pages first appear more often, then start earning clicks, then hold higher positions.

WEEKS 1-3

Google re-reads the site

The rewritten pages and both guides get re-crawled and indexed. Nothing visible changes yet.

WEEKS 3-8

Visibility rises before clicks do

Expect the pages to start appearing for more searches. This shows up as rising impressions in the data before any change in enquiries.

MONTH 3+

Positions consolidate

Where the new content is genuinely better than what currently ranks, pages move up and start earning clicks from people searching for the service rather than the company name.

The one thing that will help most from your side: a steady flow of genuine Google reviews. Review count and recency are among the strongest factors in whether you appear in the local map results, and it is the one area where competitors with less technical work behind them can still outrank you. One review a month, asked for in the week after a job is handed over, compounds faster than anything else available to you.

MEASUREMENT

How progress gets tracked

Baseline figures have been recorded for every page that was rewritten, along with the searches your site currently appears for. The next report compares directly against those numbers, in both directions, using data from Google Search Console rather than estimates. No claim in this report, or the next one, rests on anything that cannot be independently verified.

Questions about anything in this report?

Every figure here can be reproduced on request, and the underlying audit data is retained. If you would like the technical detail behind any section, or want to talk through the priorities on the previous page, get in touch any time.
