

SEARCH PERFORMANCE · REPORT 02

One month *after the work*

What changed on stablestructure.co.nz in the first month after the search optimisation work, measured against the recorded baseline.

PREPARED FOR

Gajanthan Vethanathan

Director, Stable Structure Limited

PREPARED BY

PERIOD

9 Aug – 5 Sep 2026

vs 29 Jul – 8 Aug

THE SHORT VERSION

The work is doing what it was meant to do

Your site is now shown to more than twice as many searchers, across nearly four times as many different searches, and both new guides have reached the first page of Google. Every page we rewrote has moved up. One number went down, and this report explains why before anything else.

+110%	350	2	21
More times shown in search results, per day	Different searches you appear for, up from 94	New guides, both on page one of Google	Visits to guides that did not exist a month ago

THE ONE NUMBER THAT FELL

Total visits dipped, and it is not the search work

Total visits from Google fell against the baseline period. That deserves a straight answer rather than a footnote.

The baseline contained a **launch spike**. On 30 July alone the site took 40 visits, which is **44% of every visit in the whole baseline period** — almost certainly people looking the business up after the new site was announced. A burst like that is an event, not a level to be sustained.

Since then, searches for your *company name* fell away as launch interest faded, while searches for your *services* grew. The evidence is clear:

Every page we rewrote moved up

Position is where your page sits in Google's results. Lower is better: position 10 is roughly the bottom of page one, position 40 is page four, where nobody looks.

PAGE	POSITION THEN	POSITION NOW	VISITS
Retaining Walls	45.2	18.5	0 → 12
Site Inspections	38.0	29.0	1 → 2
Construction Supervision	35.3	23.8	0 → 0
Structural Design	26.9	17.7	0 → 0
Building Consent Docs	22.8	16.7	0 → 1

Retaining Walls is the clearest win: it climbed **27 positions**, from page five to the top of page two, and went from no visits at all to twelve. Two pages have climbed but are not yet earning clicks, because they still sit just below the first page. That is the expected order: position improves first, clicks follow once a page crosses onto page one.

THE GUIDES

Both new guides reached page one

The two guides written last month did not exist before. Both now rank on the first page of Google and are together the largest source of non-brand visits to your site.

GUIDE	POSITION	TIMES SHOWN	VISITS
What is a PS1?	6.7	875	13
When does a retaining wall need consent?	7.8	667	8

This is the strategy working as intended. These pages reach people while they are still researching a problem, well before they are ready to phone an engineer, and they land on a page that answers the question and carries your name and chartered credentials.

Worth noting: you now appear for searches such as "what is a ps1", "ps1 building consent", "retaining wall regulations nz" and "do retaining walls need council approval" — none of which you appeared for at all a month ago.

NEXT OPPORTUNITIES

Where the next gains are

1 391 times shown on page one, with no visits

You now rank on the first page for terms including "retaining wall", "structural engineer" and "ps1", but they are not producing clicks yet. This is the single biggest opportunity and the first thing to investigate next month. It usually means either the search listing itself needs to be more compelling, or Google is answering the question directly above your result.

2 The carports and sheds page

Shown 396 times this month, up from 5, but sitting at position 35. It is one of the five service pages not yet rewritten, and the demand is clearly there. Rewriting it is the most direct next step.

3 Portal frame demand across the North Island

A cluster of searches has appeared for portal frame sheds and garages in Rotorua, Taupo, Hamilton and Hawke's Bay. You rank poorly for them today, but the demand is real and largely unclaimed.

4 The four remaining thin service pages

Civil design, pools, decks and carports still carry roughly a fifth of the content of the rewritten pages. They remain the clearest gap on the site.

TECHNICAL NOTE

An old web address still holds some of your ranking

Google still has the older, insecure version of your homepage address in its index. It accounts for about a quarter of all your visits, and for the valuable search "structural engineer auckland" it currently ranks better than the correct secure address does.

We checked the site and it behaves correctly: the old address permanently redirects to the secure one in a single step, and the page correctly tells Google which version is the official one. **There is nothing to fix.** Google simply takes time to merge the two, and when it does, that ranking should transfer across.

Why this matters for the numbers: depending on which report is opened in Google's tools, this month reads as either 131 visits or 98 for the same period. The higher figure is the complete one. This report uses it throughout, and future reports will use the same source so comparisons stay honest.

IN SUMMARY

Where things stand

One month in, the pattern is the one set out in the first report: visibility rises first, clicks follow. Visibility has more than doubled and the first service-search clicks are arriving. The brand-search spike from launch has faded, which makes the headline number look flat, but everything underneath is moving the right way.

The next report will compare against this month rather than the launch period, giving a cleaner read now the launch distortion has washed through.

Questions about any of this?

Every figure in this report comes from Google Search Console and can be reproduced on request. The underlying data is retained so each month's comparison stays checkable against the last.
